

ENABLING AUTOLIGATURES AND CONTEXTUAL ALTERNATES: The advanced features of this typeface require autoligatures and contextual alternates to be active in your graphics apps. Most programs have these features automatically activated, but if you install this typeface and notice that the special features aren't appearing, you may need to manually activate them in the Type, Character, Text, or OpenType window of your program. (Note that some apps may not allow you to use autoligatures or contextual alternates at all. Check with their individual manufacturers.) See below for the most common Adobe instructions.

To make sure autoligatures and contextual alternates are turned on by default in your apps, open the app, and without opening any document, enable the autoligatures and contextual alternates as above. To set the defaults for certain documents, perform the same process, but with a blank document open.
